2. Literature Review

2.1 Feedback & Evaluation

Lecturer's assessment of ECHO Egypt will focus on the project's idea, relevance to the tourism sector, technical feasibility, and alignment with the project objectives.

The evaluation should consider the proposed features, the selected technologies, the project scope, and the feasibility of implementing the MVP within the available timeframe.

Lecturer's Feedback: To be completed after receiving the lecturer's assessment.

2.2 Suggested Improvements

The following improvements may enhance ECHO Egypt:

- Improve AI recommendations using user interests, moods, budget, and travel duration.
- Improve the accuracy and reliability of destination and experience information.
- Enhance the Memory-to-Experience feature to generate more relevant travel plans.
- Improve interface usability and responsiveness across different devices.
- Strengthen authentication, authorization, and user data protection.
- Expand content moderation (for example, flagging options and automated checks) to maintain the quality of user-generated memories.
- Optimize application performance and database queries.
- Conduct usability testing and collect feedback from potential users.

2.3 Final Grading Criteria

The final grading criteria will follow the assessment rubric provided by the DEPI lecturer.

The following table represents proposed assessment categories and is not an official DEPI grading breakdown.

Assessment Category	Description	Marks
Documentation	Project documentation, requirements, analysis, and design	To be confirmed
Implementation	Source code, functionality, and execution	To be confirmed
Testing	Test cases, results, and bug reports	To be confirmed
Final Presentation	Project explanation, demonstration, and outcomes	To be confirmed
Total		To be confirmed

Note: The final marks and percentages must be added according to the official grading rubric provided by the lecturer.

2.4 Related Work (Reference Platforms)

ECHO Egypt builds on patterns that already work in existing travel platforms. The table below summarizes the reference platforms identified in the project's competitive research and how ECHO Egypt intends to differ from them.

Reference Platform	Strength Referenced	ECHO Egypt Approach
Wanderlog	Itinerary timelines, trip planning, and route optimization.	Builds itineraries from a real traveler memory combined with the user's mood, budget, and duration.
Polarsteps	Travel journaling and trip documentation.	Treats a memory as a discoverable experience that others can repeat, not only a record of a trip.
Airbnb Experiences	Bookable experiences and personalized discovery.	Focuses deeply on Egypt and connects experiences to places, memories, and local culture.
TripAdvisor	Reviews, restaurants, and tourism information.	Links places and businesses to the memories people created there instead of competing on listing volume.
Expedia / Booking.com	AI-assisted trip planning.	Combines AI planning with real memories and user preferences rather than relying on AI generation alone.
